Cheat Sheet: API's and Data Collection

Package/Method	Description	C	Code Example
		Syntax:	
Accessing element attribute	Access the value of a specific attribute of an HTML element.	1. 1	
		1. attribute = element[(attribute)]	
		Copied!	
		Example:	
		1. 1	
		<pre>1. href = link_element[(href)]</pre>	
		Copied!	
		Syntax:	
BeautifulSoup()	Parse the HTML content of a web page using BeautifulSoup. The parser type can vary based on the project.	1. 1	
		<pre>1. soup = BeautifulSoup(html, (html.parser))</pre>	
		Copied!	
		Example:	
		1. 1	
		<pre>1. html = (https://api.example.com/data) soup = BeautifulSoup(html,</pre>	(html.parser))
		Copied!	
delete()	Send a DELETE request to remove data or a resource from the server. DELETE requests delete a specified resource on the server.	Syntax:	
		1. 1	
		1. response = requests.delete(url)	
		Copied!	
		Example:	
		1. 1	
		<pre>1. response = requests.delete((https://api.example.com/delete))</pre>	
		Copied!	
		Syntax:	
find()	Find the first HTML element that matches the specified tag and attributes.	1. 1	
		1. element = soup.find(tag, attrs)	
		Copied!	
		Example:	
		1. 1	
		<pre>1. first_link = soup.find((a), {(class): (link)})</pre>	
find_all()	Find all HTML elements that match the specified tag and attributes.	Copied!	
		Syntax:	
		1. 1	

```
1. elements = soup.find_all(tag, attrs)
                                                     Copied!
                                                   Example:
                                                      1. 1
                                                      1. all_links = soup.find_all((a), {(class): (link)})
                                                     Copied!
                                                   Syntax:
                                                      1. 1
                                                      1. children = element.findChildren()
                                                    Copied!
                 Find all child elements of an
findChildren()
                 HTML element.
                                                   Example:
                                                      1. 1
                                                      1. child_elements = parent_div.findChildren()
                                                    Copied!
                                                   Syntax:
                                                      1. 1
                  Perform a GET request to retrieve
                                                      1. response = requests.get(url)
                  data from a specified URL. GET
                                                     Copied!
                 requests are typically used for
                 reading data from an API. The
get()
                                                   Example:
                 response variable will contain the
                 server's response, which you can
                                                      1. 1
                  process further.
                                                      1. response = requests.get((https://api.example.com/data))
                                                    Copied!
                                                    Syntax:
                                                      1. 1
                                                      1. headers = {(HeaderName): (Value)}
                  Include custom headers in the
                                                    Copied!
                  request. Headers can provide
Headers
                 additional information to the server,
                                                   Example:
                 such as authentication tokens or
                 content types.
                                                      1. 1
                                                      1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = requests.get(base_url, headers=headers)
                                                     Copied!
                                                   Syntax:
                                                      1. 1
                 Import the necessary Python
Import Libraries
                  libraries for web scraping.
                                                      1. from bs4 import BeautifulSoup
                                                    Copied!
                  Parse JSON data from the
json()
                                                    Syntax:
                 response. This extracts and works
                                                      1. 1
                  with the data returned by the API.
                  The response.json() method
                                                      1. data = response.json()
                  converts the JSON response into a
```

about:blank 2/5

```
Python data structure (usually a
                                                     Copied!
                  dictionary or list).
                                                    Example:
                                                      1. 1
                                                      1. response = requests.get((https://api.example.com/data)) data = response.json()
                                                     Copied!
                                                    Syntax:
                                                      1. 1
                                                      1. sibling = element.find_next_sibling()
                                                     Copied!
                  Find the next sibling element in the
next_sibling()
                  DOM.
                                                    Example:
                                                      1. 1
                                                      1. next_sibling = current_element.find_next_sibling()
                                                     Copied!
                                                    Syntax:
                                                      1. parent = element.parent
                                                     Copied!
                  Access the parent element in the
parent
                  Document Object Model (DOM).
                                                    Example:
                                                      1. parent_div = paragraph.parent
                                                     Copied!
                                                    Syntax:
                                                      1. 1
                                                      1. response = requests.post(url, data)
                  Send a POST request to a specified
                  URL with data. Create or update
                                                     Copied!
                  POST requests using resources on
post()
                  the server. The data parameter
                                                    Example:
                  contains the data to send to the
                  server, often in JSON format.
                                                      1. 1
                                                      1. response = requests.post((https://api.example.com/submit), data={(key): (value)})
                                                     Copied!
                                                    Syntax:
                                                      1. response = requests.put(url, data)
                  Send a PUT request to update data
                  on the server. PUT requests are
                                                     Copied!
                  used to update an existing resource
put()
                  on the server with the data
                                                    Example:
                  provided in the data parameter,
                  typically in JSON format.
                                                      1. 1
                                                      1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                                                     Copied!
```

about:blank 3/5

```
Syntax:
                                                      1. 1
                                                      1. params = {(param_name): (value)}
                                                    Copied!
                  Pass query parameters in the URL
                  to filter or customize the request.
                                                   Example:
Query parameters Query parameters specify
                 conditions or limits for the
                                                      1. 1
                                                      2. 2
                  requested data.
                                                      3. 3
                                                      1. base_url = "https://api.example.com/data"
                                                      2. params = {"page": 1, "per_page": 10}
                                                      3. response = requests.get(base_url, params=params)
                                                    Copied!
                                                   Syntax:
                                                      1. 1
                                                      1. element = soup.select(selector)
                  Select HTML elements from the
select()
                 parsed HTML using a CSS selector. Example:
                                                      1. titles = soup.select((h1))
                                                    Copied!
                                                   Syntax:
                                                      1. 1

    response.status_code

                  Check the HTTP status code of the Copied!
                 response. The HTTP status code
                 indicates the result of the request
                                                   Example:
status code
                  (success, error, redirection). Use
                  the HTTP status codeIt can be used
                                                     1. 1
                                                      2. 2
                  for error handling and decision-
                                                      3. 3
                 making in your code.
                                                      1. url = "https://api.example.com/data"
                                                      2. response = requests.get(url)
                                                      3. status_code = response.status_code
                                                    Copied!
tags for find() and Specify any valid HTML tag as the Tag Example:
find all()
                 tag parameter to search for
                                                      1. 1
                  elements of that type. Here are
                                                      2. 2
                 some common HTML tags that you
                                                      3.3
                  can use with the tag parameter.
                                                      4.4
                                                      5.5
